For Immediate Release

MILLER EDGE, INC. FORMS OEM PARTNERSHIP WITH CASTELL

West Grove, PA (August 14, 2008)

MillerEdge adds loading dock protection to its portfolio with addition of Castell's Salvo drive-away prevention. To increase customer support across North America, Miller Edge has formed a new OEM partnership with Castell, to carry the company's Salvo dock safety system.

Since the inception of the industrial safety industry, Castell has been a leader in trapped key interlocking technology, developing products that keep pace with the needs of emerging markets and applications in all business sectors. Their products go beyond meeting legislation to create the safest working environments possible. A member of the global Halma group, Castell has its US offices in Erlanger, Kentucky.

MillerEdge will provide complete sales and service support for the Salvo product, which prevents injury and damage to loading platforms by making it impossible for trucks to drive away during loading or unloading. Once the Salvo's Glad Hand lock is attached to the truck's brake line, ensuring that brakes are applied and trailer movement has stopped, a uniquely coded key is released. The key is then used in either the automatic or manual door lock, which traps the key, and allows workers inside the plant to unbolt the lock and begin loading or unloading the trailer. When work on the trailer is complete, the door interlock is bolted and the key needed to open the Salvo Glad Hand brake lock is released, making it possible for the driver to depart

From its facilities in Jennersville, Pa. and Tempe, Az., MillerEdge's engineering staff will provide on-site assessments, and design engineering assistance to Miller Edge customers in the United States and Canada. Contact MillerEdge at www.MillerEdge.com, or phone (800) 220-3343.
